Abstract:

This paper deals with a range of display panels for the museum “Science and Technology in Islam” study and analysis to extract the foundations and construction elements used in the design of the museum interactive display panels; in order to activate educational role of the museum through the role played by technology. Museums all over the world are no longer a place to save and store Antiquities just as in the past, but have become centers for cultural communication between the past, the present and educational institutions. Therefore we must catch up with the technology and rethink to exploit it in the Egyptian museums to attract the largest number of visitors in various categories, age and level of their culture.
