Abstract

The city of Greater Cairo contains many areas that are not well exploited, specially which are located on the Nile façade both inside and outside the city, Especially the Nile façade in the area of Rawd al-Faraj, but also we find that these uses are competing and have a negative impact on the Nile façade. Not exploiting them leads to significant economic losses, which, if exploited, will have a strong economic return Because of its unique economic resources, this place overlooks directly on the Nile façade . Therefore, through this research we will be exposed to the knowledge of the uses of the land that was located on the Nile facades in the past and the most important theories that touched on this subject. Many scientists have taken care of the Nile façade in order to reach the most appropriate and exploitative uses of this important economic resource on which some countries are based and rely directly on it as one of the sources of economic and national income for them. Then learn about the different uses that have been localized on the Nile facades of some countries, whether at the global level or local. And apply these results and indicators on the Nile façade in the area of Rawd al-Faraj to see the best uses that can be suggested on this interface there in order to exploit this interface to exploit the best so that it has a strong economic and tourism return. Especially since the state in its strategy tends to exploit these areas, this has become an urgent necessity for every architect or urban and economic expert to show the importance of these regions and their impact on the economies of countries.

Keywords:

Land uses - Nile façades – Tourism.
