

Sustainable methods to upcycle clothing using artistic techniques

Dr. Rania Elgamal

Assistant Professor in Fashion Design & Textile Printing Faculty of Applied Arts, the 6th
of October University, Giza, Egypt

Raniaelgamal.art@o60.edu.eg

Abstract

The garment industry plays an essential role in contemporary life, functioning as a supplier of basic human necessities, and a significant driver of global and local economies. It provides livelihoods to diverse stakeholders, from textile, garment manufacturers and artisans to entire nations (Fletcher and Grose 2012; Choudhury 2018). Despite its vital importance, the industry's practices have contributed extensively to environmental degradation (Bick, Halsey, and Ekenga 2018; Bailey, Basu, and Sharma 2022). This contradiction raises a critical question: how can such a pivotal industry align its operations with the planet's ecological well-being?

The lifecycle of clothing, encompassing raw material extraction, textile processing, finishing techniques, and post-consumer disposal, exerts immense pressure on natural resources while polluting land, air, and water (Fletcher 2016; Peters, Li, and Lenzen 2021). Adding to this, the growth of online shopping, flexible return practices has changed consumer preferences and resulted in increased shares of returned and unsold garments (Franco 2019; Peters et al. 2021). Over the past years, fast fashion as well as luxury brands, have been reported to destroy returned or unsold clothing (Niinimäki et al. 2020; Sandin, Peters, and Svanström 2019).

An innovative solution for the garment industry lies in repurposing this category of produced garments to transform what was once considered refuse into valuable resources (Govindan and Hasanagic 2018; Muthu 2021). A sustainable sub-sector within major clothing brands could focus on redirecting unused materials from collections and collaborating with small-scale businesses to craft unique, high-quality products (Maharaj 2021; Singh and Kumar 2021). Through upcycling, the industry, artisans, and craftspeople could transform these textiles into bespoke designs marketed as premium items, offering them a second life (Shim, Kim, and Na 2018; Cassidy and Han 2017). This approach provides a triple advantage: reducing textile waste, generating economic opportunities, and promoting creativity in fashion (Aus et al. 2021; Sandin and Peters 2018). It aligns seamlessly with the principles of circular economy models, which emphasize resource reuse and longevity (Dahlbo et al. 2017; Muthu 2021). This research will delve into artistic methods, such as advanced textile printing and traditional handicrafts, that could revolutionize waste management in the clothing sector (Kouhizadeh, Saberi, and Sarkis 2021; Fletcher and Grose 2012). The aim is to integrate environmental responsibility with aesthetic innovation, crafting a path for a more sustainable future in fashion (Singh and Giacomini 2021; Kamleitner, Thürridl, and Martin 2019). Also, create business opportunities for the industry and creatives (Muthu 2021; Yousef et al. 2020).

Keywords

techniques - environmental problems - Upcycling – Garment Industry -Printing

Introduction

The global textile and apparel industry significantly influences economic, cultural, and social landscapes while simultaneously posing serious environmental challenges. This sector, vital to societal function and expression, consumes extensive resources and generates considerable waste. Textile production is responsible for approximately 20% of global wastewater and 10% of annual carbon emissions, making it one of the largest industrial contributors to environmental degradation (Niinimäki et al. 2020; Sandin and Peters 2018). The complex processes involved—from fiber cultivation and dyeing to garment construction and post-consumer disposal—exert immense pressure on ecosystems and deplete finite natural resources (Peters et al. 2021; Govindan and Hasanagic 2018).

A major contributor to these environmental impacts is the prevalent use of linear production models, which prioritize mass production and profitability over sustainability. These models have led to increasing quantities of textile waste, much of which ends up in landfills or incinerators. Annually, billions of garments end up incinerated or in landfills, contributing to pollution, resource wastage, and greenhouse gas emissions (Dahlbo et al. 2017; Peters, Li, and Lenzen 2021). This research explores emerging opportunities for the garment industry to adopt upcycling practices as an alternative to destroying unsold inventory, examining both environmental benefits and business potential across various upcycling techniques (Muthu 2021; Singh and Kumar 2021).

Recent studies highlight the potential of artistic and traditional techniques, such as textile printing and handicrafts, to extend the lifecycle of discarded fabrics. By transforming waste into valuable, one-of-a-kind products, these methods not only mitigate environmental impacts but also promote local economic development and cultural preservation (Shim, Kim, and Na 2018; Cassidy and Han 2017). This research aims to explore how the integration of creative practices can provide actionable pathways to reduce waste, optimize resource use, and redefine sustainability within the fashion industry (Singh and Giacomini 2021; Kamleitner, Thüridl, and Martin 2019).

I. Research problem:

- 1) How upcycling strategies can effectively address the environmental challenges associated with the rapid disposal of clothing waste?
- 2) How modern textile printing technologies can play a role in alleviating economic values in upcycling?

II. Research objectives:

- 1) To identify upcycling solutions for addressing environmental issues caused by industrial pollution.
- 2) To enhance the economic opportunities available through innovative approaches in upcycling and printing technologies.

III. Research hypothesis

The integration of advanced textile printing technologies and traditional handicraft methods into the clothing industry can significantly mitigate environmental issues by reducing textile waste and pollution, while simultaneously creating economic opportunities for young entrepreneurs

through the development of upcycled, marketable products. This hypothesis is built on the premise that sustainable practices within the fashion sector can address ecological degradation while promoting socio-economic growth

IV. Research limitations:

Time Scope of the Study: The research was done during 2023 through 2024

1Geographically limited: This research is limited to Egypt.

V. Research Framework:

1. Background and Significance.
2. Upcycling Apparel Brands through Handicrafts and Textile Printing Techniques

1. Background and Significance:

The fashion industry is one of the most resource-intensive industries, with extraordinarily complex worldwide supply chain networks and fast production and consumption cycles. The fashion industry has difficulties as a result of the extensive use of natural resources in the manufacture of fabrics and garments. The use of chemicals in textile dyeing and surface treatments, as well as other societal problems that emerge in the supply chain, are additional problems (Niinimäki et al. 2020; Sandin and Peters 2018).

The production of waste might have a variety of harmful effects on the environment, including lowered air and water quality. Fast fashion makes a major contribution to the production of textile waste and pollution. Particularly notorious for their role in the creation of wastewater and solid wastes at various stages, greenhouse gas emissions, and environmental degradation are the garment and textile industries (Peters, Li, and Lenzen 2021; Govindan and Hasanagic 2018).

The garment industry is experiencing great challenges stemming from the market scene changes with the progressive increase of online business, development of new business models based on AI technologies such as virtual fitting rooms and try-on solutions and micro factories based on customers' personal preferences and choices. All of this has created an increase in unsold items and high returns affecting the profitability and growth of the industry (Franco 2019; Peters et al. 2021).

Upcycling is a novel, environmentally conscious method of fashion design that reuses discarded clothes and textile waste and reintroduces it to the market. It is a more sophisticated form of recycling that uses the clothing or fabrics in their original form while giving them a new use and much greater quality (Shim, Kim, and Na 2018; Cassidy and Han 2017).

Companies adopting Upcycling have the ability to transform garments into stylish, eco- friendly items that extend the lifespan of current materials. It also satisfies personalization as a choice for customers by providing choices and several solutions meeting the taste of customers (Muthu 2021; Singh and Kumar 2021).

Ordinary textile materials may be creatively reused by upcycled fashion firms to create limited-edition clothing with higher pricing that reflect their smaller environmental impact. Patching, embroidery, and other refinishing methods can increase the perceived worth of repurposed goods (Singh and Giacomini 2021; Kamleitner, Thürridl, and Martin 2019). Even if they are currently small-scale, recycled fashion companies are essential in showing how reuse, upcycling, and waste reduction may lead to bigger changes in the apparel industry (Maharaj 2021; Yousef et al. 2020).

Upcycled clothing becomes a more attractive choice as customer desire for sustainably manufactured, ethical alternatives to rapid fashion increases (Niinimäki et al. 2020; Sandin and Peters 2018).

Upcycling Apparel Brands through Handicrafts and Textile Printing Techniques: **Traditional & Innovative Upcycling Techniques and Their Potential**

- **Material Deconstruction and Reformation**

Research by Paras et al. (2018) demonstrates that garments can be deconstructed to fiber or yarn level and reformed into new textiles. This technique preserves approximately 60-70% of the original material's embodied energy compared to recycling processes that break down fibers chemically or mechanically (Paras et al. 2018). Han et al. (2017) documented successful case studies where luxury brands created limited-edition collections from deconstructed unsold inventory, achieving premium pricing while reducing waste (Han et al. 2017).

- **Design Modification and Transformation**

Janigo and Wu (2015) explored how design modifications can transform unsold garments into new marketable products. Their research indicated that simple interventions like dyeing, embellishment, or structural alterations could increase consumer willingness to pay by 15-40% compared to the original garments (Janigo

and Wu 2015). Dissanayake and Sinha (2015) further demonstrated that brands implementing "zero-waste" design principles could incorporate potential future upcycling pathways into their initial design process (Dissanayake and Sinha 2015).

• **Digital Customization Technologies**

Emerging technologies are enhancing upcycling capabilities. Armstrong et al. (2020) examined how digital printing, laser cutting, and 3D design software enable precise, scalable customization of existing garments. Their findings suggest these technologies can reduce labor costs in upcycling by up to 40% while achieving consistent quality (Armstrong et al. 2020). Nayak et al. (2023) demonstrated that AI algorithms can optimize cutting patterns for maximum material utilization during deconstruction (Nayak et al. 2023).

Collaborative Consumption Models

Research by Machado et al. (2019) explored business models where brands collaborate with consumers in upcycling initiatives. Their studies showed that "take- back" programs combined with in-house upcycling increased customer loyalty and repeat purchases by 25% (Machado et al. 2019). Todeschini et al. (2017) documented successful brand-to-brand collaborations where complementary waste streams were exchanged for mutual upcycling projects, creating unique cross-brand value propositions (Todeschini et al. 2017).

• **Use of Textile Printing Techniques in Upcycling:**

Textile printing techniques, when combined with artistic handicrafts, can significantly enhance the upcycling of fashion brand clothing such as Louis Vuitton, Gucci, Chanel Hermès, Prada, Balenciaga, Dior, Burberry, and Versace, by transforming discarded textiles into new, appealing products. This approach not only offers a sustainable solution to textile waste but also allows for the creation of unique, high-value pieces that align with the evolving preferences of eco-conscious consumers (Fletcher and Grose Cassidy and Han 2017). The integration of artistic methods such as embroidery, hand painting, and textile manipulation can elevate the perceived value of upcycled garments while also preserving the quality and identity of the original brands (Han et al Shim, Kim, and Na 2018). By leveraging these techniques, these luxury brands can not only address environmental concerns but also cater to a growing market for personalized ethically produced fashion (Singh and Kumar 2021; Kamleitner, Thüridl, and Martin 2019).

• **Traditional Printing Techniques: Tie & Dye – Batik Printing – Japanese Shibori resist Dyeing**

These are all excellent dyeing techniques that can breathe new life into old garments! Each method has its unique characteristics and artistic possibilities for upcycling

Tie & Dye

This technique involves binding, folding, or twisting fabric and applying dye. The bound areas resist the dye, creating patterns. Popular patterns include:

- Spiral designs (pinch fabric center and twist)
- Stripes (accordion fold and bind at intervals)
- Bullseye patterns (pinch and bind at various points) (Fletcher 2016; Shim, Kim, and Na 2018).

Batik Printing

Batik uses wax as a resist medium: Apply melted wax to fabric using stamps, brushes or tjanting tools and dye the fabric. Batik printing represents cultural Asian motifs of (2021 interest to specific customers (Fletcher and Grose 2012; Singh and Kumar

Japanese Shibori

A sophisticated resist technique with various methods:

- Kanoko (binding): Similar to tie-dye but with precise patterns
- Arashi (pole-wrapping): Fabric is wrapped around poles for diagonal patterns
- Itajime (folding and clamping): Creates geometric patterns
- Kumo (pleating and binding): Creates spider-like patterns (Fletcher 2016; Shim, Kim, and Na 2018).

Digital Textile Printing for Garment Upcycling

Digital textile printing offers precision, versatility, and creative freedom when upcycling garments. Here's a comprehensive look at how this technology can transform old clothing into custom, refreshed pieces: (Armstrong et al. 2020; Muthu

Direct-to-Garment (DTG) Printing

DTG printing uses specialized inkjet technology to print designs directly onto fabric. This method works like a regular printer but with textile inks that bond with fabric fibers (2021 Armstrong et al. 2020; Peters, Li, and Lenzen)

:Benefits for upcycling

- Enables photorealistic, complex, multi-colored designs
- Works well on pre-made garments, including those with seams
- No minimum quantities required

- Relatively low setup costs compared to traditional methods
- Environmentally friendly with minimal waste (Armstrong et al. 2020; Muthu 2021).

:Best applications

- Adding detailed imagery to t-shirts, hoodies, and tote bags
- Creating custom patterns on plain garments
- Covering stains or worn areas with strategic designs (Armstrong et al. 2020; Peters, Li, and Lenzen 2021)

Dye-Sublimation Printing

This technique uses heat to transfer dye onto synthetic fabrics like polyester, creating permanent, vibrant images that won't crack or fade (Fletcher and Grose 2012; Armstrong et al. 2020).

:Benefits for upcycling

- Creates full-color designs that become part of the fabric
- Excellent for all-over prints and continuous designs
- Durable and washfast results
- Great for polyester and poly-blend garments (Fletcher and Grose 2012; Armstrong et al. 2020).

:Best applications

- Transforming synthetic garments with bold graphics
- Creating custom activewear from old polyester pieces
- Refreshing faded polyester items with new vibrant designs (Armstrong et al. 2020; Muthu 2021).

Digital Heat Transfer

This accessible method uses a standard inkjet printer with special transfer paper, followed by heat application (usually with an iron or heat press) (Armstrong et al. 2020; Peters, Li, and Lenzen 2021).

Benefits for upcycling

- Can be done at home with minimal equipment
- Works on various fabric types
- Great for small-batch or one-off projects
- Allows for detailed designs (Armstrong et al. 2020; Peters, Li, and Lenzen 2021).

:Best applications

- DIY home upcycling projects
- Adding small detailed designs to specific garment areas
- Creating patches to cover holes or stains (Armstrong et al. 2020; Peters, Li, and Lenzen 2021).

UV Printing

UV printing cures special inks instantly with ultraviolet light, allowing printing on diverse materials including leather, denim, and unusual textiles (Armstrong et al. 2020; Muthu 2021).

:Benefits for upcycling

- Works on challenging textiles and non-traditional surfaces
- Creates raised textural effects
- Good adhesion to various materials
- Environmentally friendly with low VOC emissions (Armstrong et al. 2020; Muthu 2021).

Best applications

- Adding designs to leather jackets or accessories
- Creating textured elements on dense fabrics like denim
- Printing on hard components of garments (buttons, toggles) (Armstrong et al. 2020; Muthu 2021).

- **Foil Stamping**

Foil stamping emerged as an added value to garments, adding metallic accents patterns, and designs to upcycled garments. This technique allows transforming plain or worn clothing into unique fashion pieces with a professional-looking finish (Fletcher and Grose 2012; Armstrong et al. 2020).

Foil Creative Applications

- Add metallic patterns to pocket details
- Create custom logos or designs on plain t-shirts
- Highlight seams or edges with metallic accents
- Cover stains or worn areas with decorative foil patterns
- Add foil text quotes or messages (Fletcher and Grose 2012; Armstrong et al. 2020).

- **Direct Drawing**

Drawing directly on garments is a fantastic method for upcycling clothing! It's creative, personal, and transforms old items into unique wearable art (Fletcher and Grose 2012; Shim, Kim, and Na 2018).

- **Adding embellishments to garments through the following techniques which can be integrated with printed patterns as well**

- **Embroidery** - Hand or machine embroidery can enhance printed designs or add completely new elements. You can embroider over parts of a print to highlight them or add texture.
- **Appliqué** - Add fabric pieces on top of printed areas to cover, enhance, or complement existing designs.
- **Beading and sequins** - These can add sparkle and texture to printed garments. They work well along the edges of printed designs or to highlight specific areas.
- **Fabric paint** - Use fabric paint to modify, enhance, or partially cover existing prints. This is especially useful for revitalizing faded designs.
- **Patches** - Decorative patches can be strategically placed to cover worn areas or to add interest to plain sections of printed garments.
- **Fabric markers or pens** - These allow for detailed customization and can be used to outline or enhance printed designs.
- **Lace or trim overlay** - Adding lace, ribbon, or decorative trim can transform a printed garment's appearance (Fletcher and Grose 2012; Armstrong et al. 2020).

D Printing for Garment Upcycling³

D printing offers exciting possibilities for upcycling clothing and textiles. Here's³
;2020 .how this technology is transforming garment upcycling: (Armstrong et al
.(2021 Muthu

Key Applications

- Replacement parts: Create buttons, zippers, clasps, or other hardware to repair damaged garments
- Embellishments: Add decorative elements to refresh outdated styles
- Structural components: Print reinforcements for worn areas or create entirely new panels
- Customization: Transform standard garments with personalized additions
- Textile innovation: Print directly onto fabric or create flexible components that integrate with textiles (Armstrong et al. 2020; Muthu 2021).

Economic and Business Opportunities

• Premium Pricing Potential

Multiple studies demonstrate consumers' willingness to pay premium prices for upcycled products. Kamleitner et al. (2019) found that upcycled fashion items commanded a 20- 35% price premium when effectively marketed with their sustainability narrative. Singh and Giacomini (2021) noted that this premium increases to 40-60% when the upcycling process involves artisanal techniques or limited-edition status (Kamleitner et al. 2019; Singh and Giacomini 2021).

• Brand Value and Consumer Perception

Upcycling initiatives positively impact brand perception. Laitala and Klepp (2018) demonstrated that brands with visible upcycling programs experienced a 15% increase in positive brand sentiment among environmentally conscious consumers. Park and Lin (2020) further documented how upcycling initiatives improved perceived authenticity and ethical positioning among younger demographics (18-35 years), who represent growing market segments with increasing purchasing power (Laitala and Klepp 2018; Park and Lin 2020).

Upcycling Projected Outcomes and Future Directions

• Environmental Benefits

Quantitative models by Sandin et al. (2019) project that widespread adoption of upcycling in the fashion industry could reduce textile waste by 45-60% by 2030. Life cycle assessments by Peters et al. (2021) indicate that upcycled garments typically have 70-80% lower carbon footprints than equivalent new items, primarily due to avoided raw material production (Sandin et al. 2019; Peters et al. 2021).

Economic Projections

Market analyses by McKinsey & Company (2023) project that the upcycled fashion market could reach \$64 billion globally by 2030, representing approximately 5-7% of the total fashion market. Brands implementing comprehensive upcycling programs have documented operational cost savings of 10-25% through reduced disposal costs and inventory efficiencies (McKinsey & Company 2023; Fashion for Good 2023).

• Innovation Trajectories

Emerging research points to promising future directions. Ribul et al. (2022) explore biological upcycling using mycelium-based processes to transform textile waste into new biomaterials. Digital technologies like blockchain are enabling transparent tracking of upcycled materials throughout their lifecycle, addressing consumer skepticism about sustainability claims (Ribul et al. 2022; Kouhizadeh et al. 2021).

:Case studies

Batik work on a white dress

Before

.Tie & Dye, a knot was made and tied on a suit, and a piece of chlorine fell on it Chlorine was added and used as a printing by removing it using the knotting and tying method, and other colors were added to change the shape to another beautiful shape

Before

After

Drawing on fabric jeans jacket direct drawing

Before

After

Use embroidery and beads either alone or with direct drawing.

Before

After

Results

1- Reducing waste and pollution by recycling fabrics and using modern printing techniques

that consume fewer resources. 2- Providing new job opportunities and supporting entrepreneurship among young people by developing innovative and sustainable products. 3- Preserving traditional crafts and increasing community awareness of the importance of sustainability in the fashion sector.

:Conclusion

This literature review reveals substantial opportunities for the garment industry to transition from destructive disposal practices toward value-creating upcycling models. The environmental benefits are clear—reduced waste, lower carbon emissions, and conservation of embodied resources (Sandin et al. 2019; Peters et al. 2021). The economic case is equally compelling, with evidence of premium pricing potential, enhanced brand value, and emerging market opportunities (Kamleitner et al. 2019; McKinsey & Company 2023).

While technical and logistical challenges remain, innovations in materials science, digital technologies, and process standardization are rapidly addressing these barriers (Ribul et al. 2022; Kouhizadeh et al. 2021). The convergence of consumer demand, regulatory pressure, and technological capability creates a favorable environment for widespread adoption of upcycling practices (Fletcher and Grose 2012; Muthu 2021).

For fashion brands, the evidence suggests that investment in upcycling capabilities represents not merely a sustainability initiative but a strategic business opportunity with potential for differentiation, resource efficiency, and future-proofing against tightening regulations and changing consumer preference (Fashion for Good 2023; Singh and Giacomini 2021).
